MODULE 1- LINUX

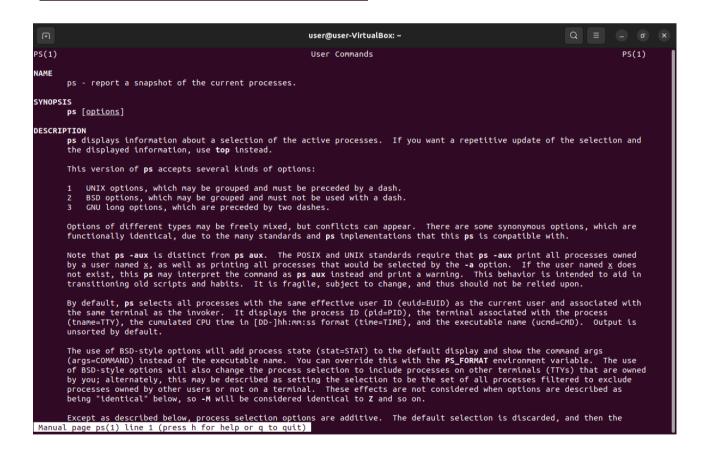

Basic Commands in Linux

1) Commands are actually files containing programs, often written in C. How will you find out in which directory does the file corresponding to the man command resides?

```
user@user-VirtualBox:~$ pwd
/home/user
user@user-VirtualBox:~$ which command
user@user-VirtualBox:~$ which man
/usr/bin/man
user@user-VirtualBox:~$
```

2) How will you find out what is the use of the ps command.

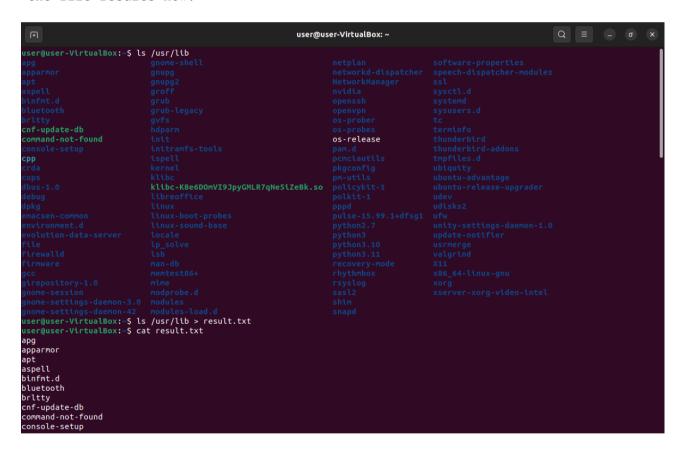

user@user-VirtualBox:~\$ man ps

General Purpose Utilities in Linux

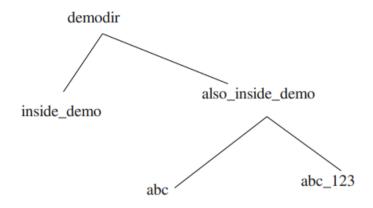

1) Display the calendar for the month of March 2012

2)List all the files and directories of the directory /usr/lib on the terminal. Now put the same information in a file named results. Display the contents of the file results now.

File Systems

1) Make a directory structure like this in your home directory

```
user@user-VirtualBox:~$ mkdir demodir
user@user-VirtualBox:~$ cd demodir
user@user-VirtualBox:~/demodir$ mkdir inside_demo
user@user-VirtualBox:~/demodir$ mkdir also_inside_demo
user@user-VirtualBox:~/demodir$ cd also_inside_demo
user@user-VirtualBox:~/demodir/also_inside_demo$ mkdir abc
user@user-VirtualBox:~/demodir/also_inside_demo$ mkdir abc_123
user@user-VirtualBox:~/demodir/also_inside_demo$
```

2) Remove the also inside demo directory

```
user@user-VirtualBox:~/demodir$ rm -r also_inside_demo
user@user-VirtualBox:~/demodir$ ls
inside_demo
user@user-VirtualBox:~/demodir$
```

File Attributes

1. Create a file abc.txt and change the ownership of this file to some other user on your machine and also change the group to family.

```
user@user-VirtualBox:~$ touch abc.txt
user@user-VirtualBox:~$ sudo useradd newuser
user@user-VirtualBox:~$ sudo chown newuser abc.txt
user@user-VirtualBox:~$ sudo usermod -g family newuser
usermod: group 'family' does not exist
user@user-VirtualBox:~$ sudo chgrp newuser abc.txt
user@user-VirtualBox:~$ ls
abc.txt
```

2. Create a file exercise.txt and make it executable.

```
user@user-VirtualBox:~$ touch excerise.txt
user@user-VirtualBox:~$ chmod +x excerise.txt
user@user-VirtualBox:~$ ls
abc.txt excerise.txt Pictures
user@user-VirtualBox:~$
```

3. Create a file test.txt on your desktop and identify its inode number, also create a soft link for test.txt in your home.

```
user@user-VirtualBox:~/desktop$ touch test.txt
user@user-VirtualBox:~/desktop$ ls -i test.txt
1507463 test.txt
user@user-VirtualBox:~/desktop$
user@user-VirtualBox:~/desktop$ ln -s home/user/desktop/test.txt ~/test_link.txt
user@user-VirtualBox:~/desktop$ ls -li home/user/desktop ~/test_link.txt
ls: cannot access 'home/user/desktop': No such file or directory
1507465 lrwxrwxrwx 1 user user 26 Sep 28 11:20 /home/user/test_link.txt -> home/user/desktop/test.txt
```

Redirection of Pipes

1. Create a file name error_log in your current directory. Suppose you do not have any file named aall in your current directory. How can you redirect the error message to the file error_log when we apply the command "wc -l aall" ? How can you ensure that all the error log are appended to the error log file?

```
user@user-VirtualBox:~/desktop$ touch error_log
user@user-VirtualBox:~/desktop$ wc aa11
wc: aa11: No such file or directory
user@user-VirtualBox:~/desktop$ wc aa11 2> error_log.txt
user@user-VirtualBox:~/desktop$ cat error_log.txt
wc: aa11: No such file or directory
user@user-VirtualBox:~/desktop$
```

2. Create files named test1, test2, testa, testb

How can you count the number of files starting with test and then having only one digit in their name using only a single line command?

```
user@user-VirtualBox:-/testtest$ touch testa.txt
user@user-VirtualBox:-/testtest$ touch testb.txt
user@user-VirtualBox:-/testtest$ touch test1.txt
user@user-VirtualBox:-/testtest$ touch test2.txt
user@user-VirtualBox:-/testtest$ ls -l test* | wc -l
4
user@user-VirtualBox:-/testtest$
```

Linux process

1. Open a terminal. Now spawn three shell processes one after another i.e. first spawn one shell, then from the spawned shell, spawn one new shell and so on. Now, how can you see the PID of the current shell? How can you see the PID of the shell which is the grandparent of the current shell?

```
ser@user-VirtualBox:~$ echo $$
21333
user@user-VirtualBox:~$ sh
$ pwd
/home/user
$ echo "Hello world"
Hello world
S ls
                                 desktop info.txt
files 'MODULE 3.odt'
 ASSIGN_LINUX1.odt
                                                                'MODULE 5.odt'
                                                                                    qwerty
                                                                                                          test1.txt
                                                                                                                         testa.txt
                                                                                                                                       test.sh
                                                                                                  snap
'ASSIGN_LINUX1 word.docx' files

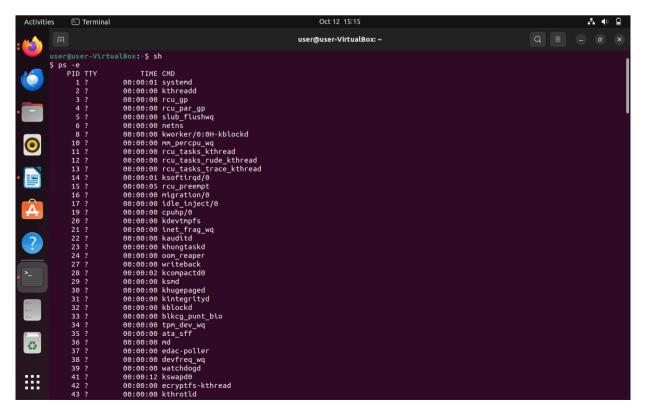

$ echo $$

22415
                                                                                     redir.sh test
                                                                 Pictures
                                                                                                          test2.txt
                                                                                                                         testb.txt
                                                                                                                                       testtest
$ ps
  PID TTY
21333 pts/1
22415 pts/1
                         TIME CMD
                    00:00:00 bash
00:00:00 sh
  22434 pts/1
                    00:00:00 ps
                      PPID C STIME TTY
19271 0 14:40 pts/1
21333 0 15:08 pts/1
               PID
                                                        TIME CMD
UID
                                                    00:00:00 bash
user
             21333
             22415
                                                    00:00:00 sh
user
             22486
                       22415 0 15:10 pts/1
                                                    00:00:00 ps -f
```

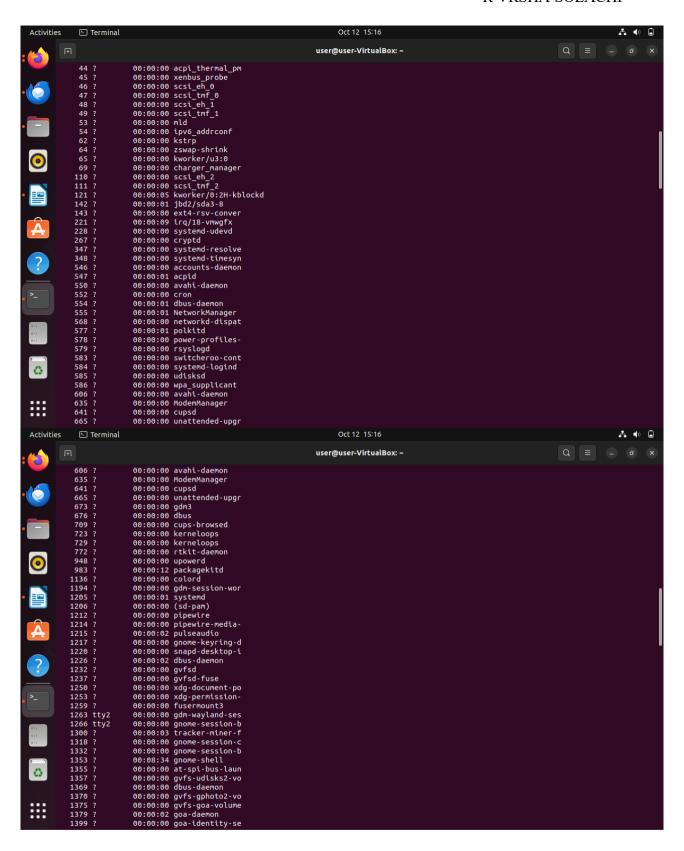

PID	PPID
21333	19271
22415	21333
22486	22415

PPID of the current shell is given by the PID of the previous shell. This makes the first shell as the grandparent, second shell as parent and third shell as child.

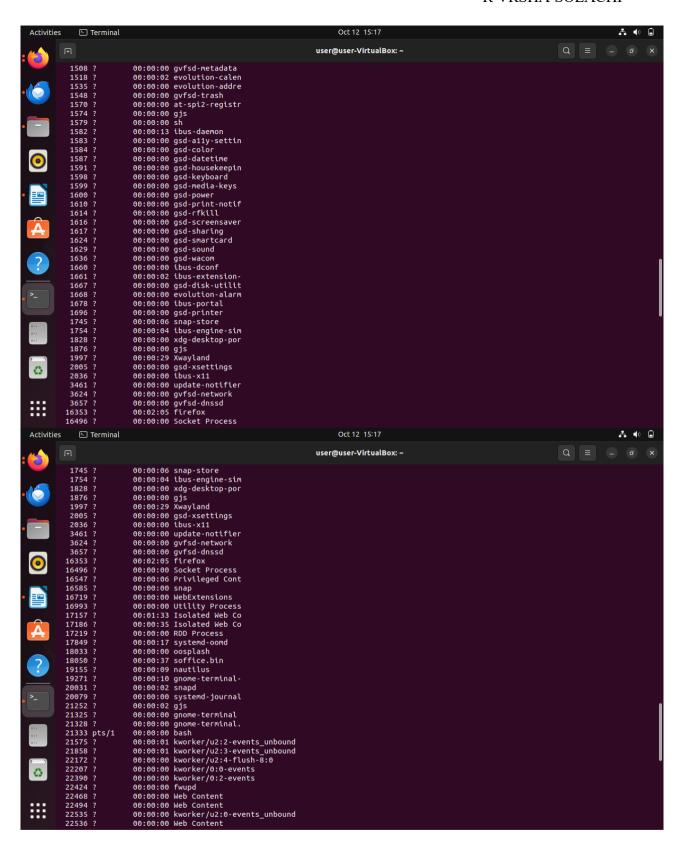

2. How can you see all the processes (both system & user processes) in your computer?

R VRSHA SOLACHI

R VRSHA SOLACHI

The output can be quite large. How can you view the output as multipage output $^{\circ}$

```
ps -e | more
PID TTY
                                                              TIME CMD
                                                 00:00:01 systemd
